关键词 离散预测控制, 广义谱分解, 双重准则.

1 引言

文[1]已指出, 文[2]不具有预测控制的基本特点, 并且忽略了噪声对系统的影响. 本文基于文[2]的思想, 在设计预测控制系统时直接考虑噪声的影响.

2 系统描述及预测估计

记 $f \stackrel{\Delta}{=} f(z^{-1})$, $f^* \stackrel{\Delta}{=} f^T(z)$, 其它符号的意义和文[1]类同. 参考文[2], 考虑如图1所示的二自由度控制系统, 其中 $W_r = E(z^{-1})/A_r(z^{-1})$, $W_d = C(z^{-1})/A(z^{-1})$, $W_v = z^{-1} \times D(z^{-1})/A(z^{-1})$, $W = z^{-1}B(z^{-1})/A(z^{-1})$, $H_f = z^{-k_0}$. 令 $A(z^{-1}) = \Delta a(z^{-1})$, $D(z^{-1}) = \Delta d_0(z^{-1})$, $\Delta = 1 - z^{-1}$. 仿文[1]得图1的等价模型

$$A(z^{-1})y(k) = B(z^{-1})\Delta u(k-1) + D_n(z^{-1}) \in (k). \quad (1)$$

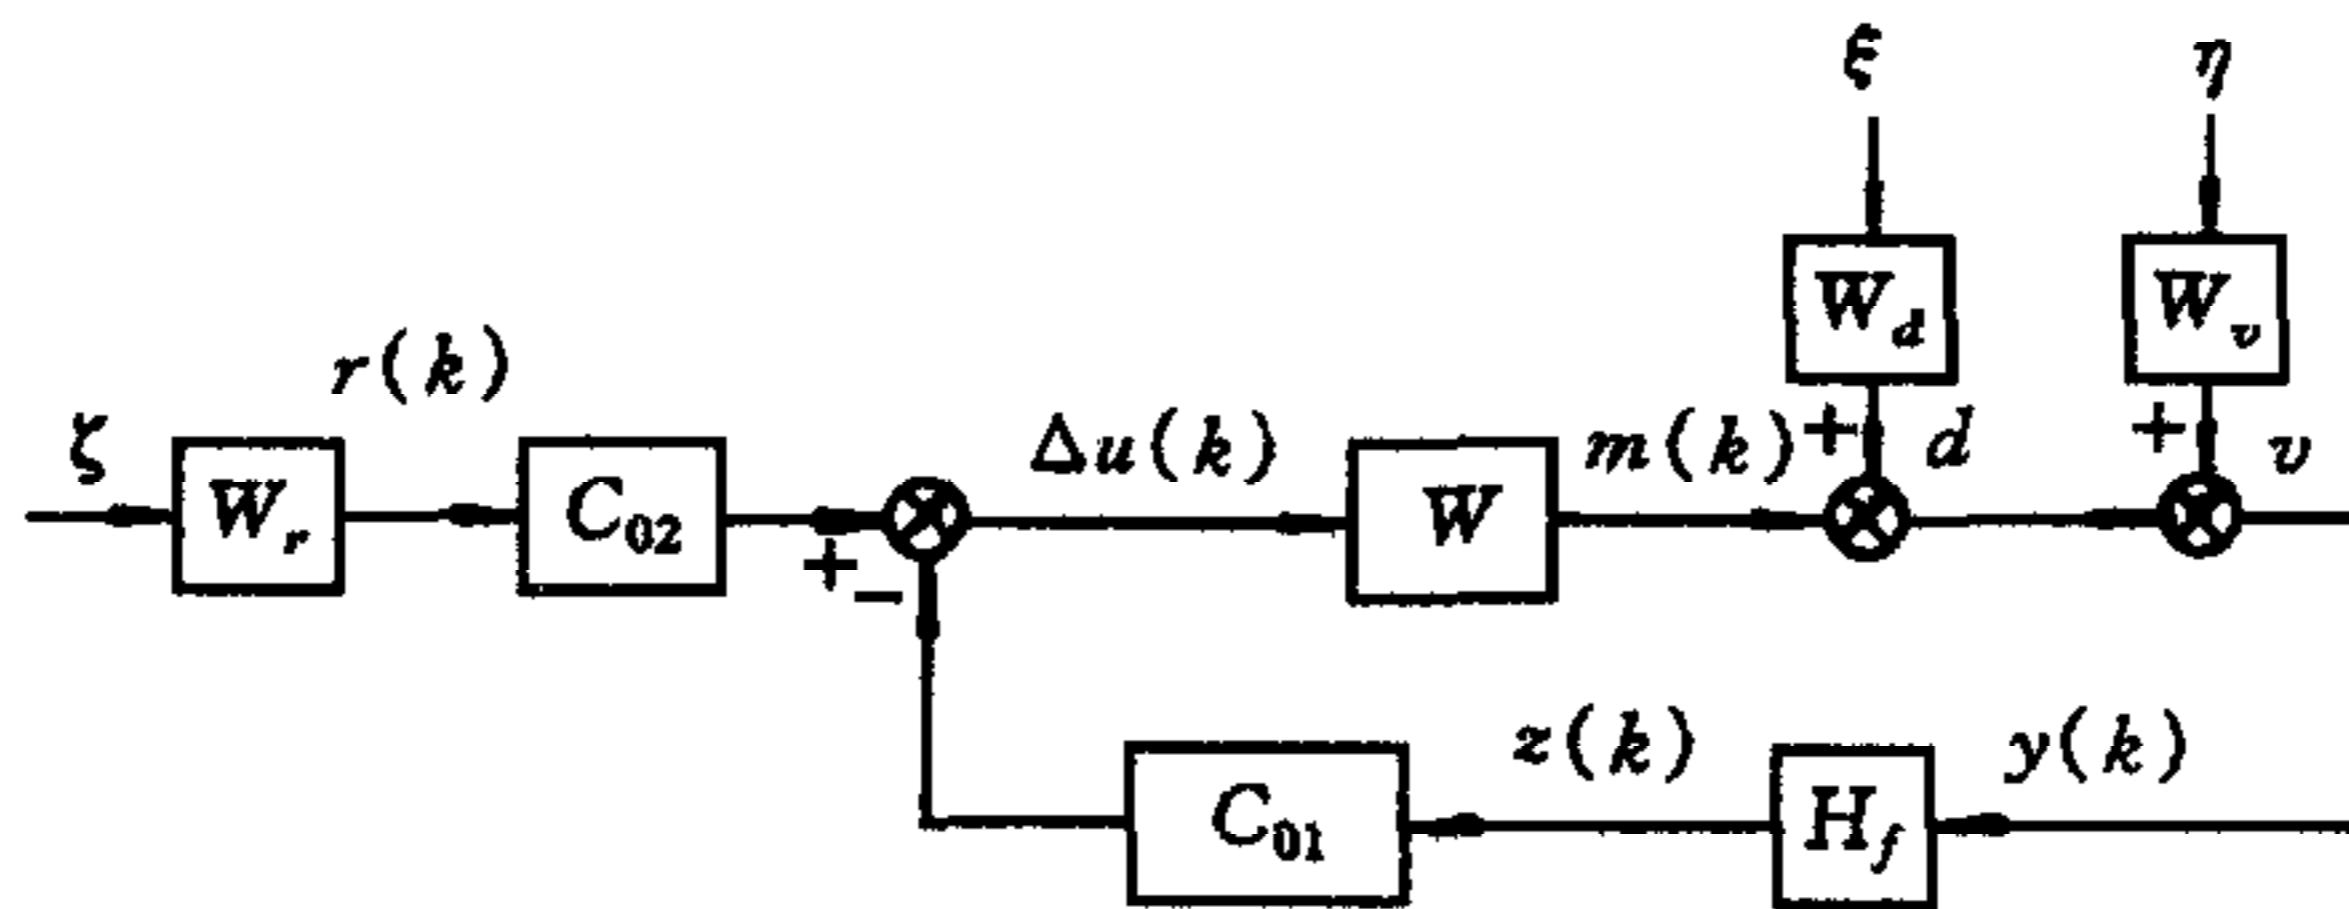

图1 二自由度离散闭环控制系统

预测估计下式^[2,3]

$$\hat{y}(k+i) = H_i \Delta \hat{u}(k+i-1) + F_{di} y(k) + G_{di} \Delta u(k-1), i = 1, 2, \dots, P, \quad (2)$$

1) 国家自然科学基金和河南省教委自然科学基金资助课题.

$$\begin{cases} \hat{y}(k+i) = WS_iC_{i2}r(k+i) + S_iF_{di}d_v(k), \\ \Delta\hat{u}(k+i) = S_iC_{i2}r(k+i) - M_iF_{di}d_v(k), i = 0, 1, \dots, P, \end{cases} \quad (3)$$

其中 $F_{di} = F_i/D_n, G_{di} = G_i/D_n, D_n = AE_i + z^{-i}F_i, BE_i = D_nH_i + z^{-i}G_i$ ^[3]. 记 N_u 为控制时域^[3], $H_i(z^{-1}) = h_0 + h_1z^{-1} + \dots + h_{i-1}z^{-(i-1)}$.

定义. 若 $i \leq N_u$, 则 $\bar{H}_i(z^{-1}) = H_i$; 否则 $\bar{H}_i(z^{-1}) = h_{i-N_u} + h_{i-N_u+1}z^{-1} + \dots + h_{i-1}z^{-(N_u-1)}$. 注意到 $F_{d0} = 1$, 由式(3)和(2)可得

$$\hat{Y} = \hat{H}\hat{U} + \hat{F}_d d_v(k) + \hat{F}_r S_0 C_{02} r(k), \quad (4)$$

$$\hat{U} = S_c r(k) - M_c d_v(k), \quad (5)$$

其中 $\hat{Y} = [\hat{y}(k+1), \hat{y}(k+2), \dots, \hat{y}(k+P)]^T, \hat{U} = [\Delta\hat{u}(k), \Delta\hat{u}(k+1), \dots, \Delta\hat{u}(k+N_u-1)]^T, \hat{H} = [H_x^T, H_z^T]^T, H_x = \text{diag}\{\bar{H}_i\}_{i=1, \dots, N_u}, H_z \text{ 为 } (P-N_u) \times N_u \text{ 阵, 第 } N_u \text{ 列为 } [\bar{H}_{N_u+1}, \dots, \bar{H}_P]^T$, 其它元素为 0; $\hat{F}_r = [z^{-1}(G_{d1} + F_{d1}\frac{B}{A}), \dots, z^{-1}(G_{dP} + F_{dP}\frac{B}{A})]^T, \hat{F}_d = [F_{d1}, \dots, F_{dP}]^T - \hat{F}_r M_0, S_c = [S_0 C_{02}, S_1 C_{12} z, \dots, S_{N_u-1} C_{(N_u-1)2} z^{N_u-1}]^T, M_c = [M_0, M_1 F_{d1}, \dots, M_{N_u-1} F_{d(N_u-1)}]^T$.

3 预测控制算法

仿文[1], 取综合指标函数

$$J = J_1 + J_2, \quad (6)$$

其中 $J_1 = E\{(\hat{Q}\hat{e})^T(\hat{Q}\hat{e}) + (\hat{R}\hat{U})^T(\hat{R}\hat{U})\} = \frac{1}{2\pi j} \oint_{|z|=1} \{\text{trace}(Q^* Q \Phi_{\hat{e}\hat{e}}) + \text{trace}(R^* R \Phi_{\hat{U}\hat{U}})\}$
 $\frac{dz}{z}, \hat{e} = \hat{Y} - Y_{\text{ref}}, Y_{\text{ref}} = [r(k+1), \dots, r(k+P)]^T, Q = \text{diag}\{Q_i\}_{i=1, 2, \dots, P}$ 和 $R = \text{diag}\{R_i\}_{i=1, 2, \dots, N_u}$ 为加权矩阵, $J_2 = \frac{1}{2\pi j} \oint_{|z|=1} [W_1 W_1^* S_0 H_f (\Phi_{dd} + \Phi_{vv}) H_f^* S_0^* + W_2 W_2^* (1 - S_0)(\Phi_{dd} + \Phi_{vv})(1 - S_0^*)] \frac{dz}{z}$.

取 $Q_i = Q_{ni}/A_w (i = 1, \dots, P), R_i = R_{n1}/A_w, W_1 = W_{n1}/A_w, W_2 = A W_{n2}/A_w$. 将式(6)中各项展开, 把不含 C_{i1} 和 $C_{i2} (i = 1, 2, \dots, N_u-1)$ 而含 C_{01} 和 C_{02} 的项分离出来, 求解 C_{01} 和 C_{02} . 现概括为如下定理.

定理1. 对图1所示的二自由度闭环系统, 指标函数式(6)的极小化解使闭环系统内稳, 并且

$$C_{01} = \frac{C_{n1}}{C_{d1}} = \frac{K}{T} z^{k_0}, \quad C_{02} = \frac{K_0 D_n D_{c1}}{T D_{c2} E} z^P. \quad (7)$$

闭环反馈系统的特征多项式 ρ 、灵敏度 S_0 、补灵敏度 $1 - S_0$ 及控制灵敏度 M_0 分别为

$$\begin{aligned} \rho &= AC_{d1} + z^{-1}BH_f C_{n1} = D_{c1}, \\ S_0 &= \frac{AT}{D_{c1}}, \quad 1 - S_0 = \frac{z^{-1}BK}{D_{c1}}, \quad M_0 = \frac{AK}{D_{c1}}. \end{aligned} \quad (8)$$

上式中各符号满足如下关系:

$$D_{c1}^* D_{c1} = D_{c2}^* D_{c2} + (W_{n1}^* W_{n1} + W_{n2}^* W_{n2} A^* A) B^* B D_n^* D_n, \quad (9)$$

$$\begin{aligned}
D_{c2}^* D_{c2} = & Q_{n1}^* Q_{n1} [\bar{H}_1 \bar{H}_1^* A^* A D_n^* D_n + \bar{H}_1 z (A^* G_1^* + B^* F_1^*) A D_n + z^{-1} \times \\
& (A G_1 + B F_1) \bar{H}_1^* A^* D_n^*] + \sum_{i=1}^P Q_{ni}^* Q_{ni} (A G_i + B F_i) (G_i^* A^* + F_i^* B^*) + \\
& R_{n1}^* R_{n1} A^* A D_n^* D_n,
\end{aligned} \tag{10}$$

且 D_{c1}, D_{c2} 稳定.

$$\begin{aligned}
D_{c1}^* z^{-g} K + L(A_w A) = & [Q_{n1}^* Q_{n1} \bar{H}_1^* D_n^* A^* F_1 + \sum_{i=1}^P Q_{ni}^* Q_{ni} z (G_i^* A^* + \\
& F_i^* B^*) F_i + W_{n1}^* W_{n1} z B^* D_n^* D_n] z^{-g},
\end{aligned} \tag{11}$$

$$\begin{aligned}
D_{c1}^* z^{-g} T - L(z^{-1} A_w B) = & [Q_{n1}^* Q_{n1} \bar{H}_1^* \bar{H}_1 A^* D_n^* D_n + Q_{n1}^* Q_{n1} \bar{H}_1 z (G_1^* A^* + F_1^* B^*) \times \\
& D_n + Q_{n1}^* Q_{n1} z^{-1} G_1 \bar{H}_1^* A^* D_n^* + \sum_{i=1}^P Q_{ni}^* Q_{ni} G_i (G_i^* A^* + \\
& F_i^* B^*) + R_{n1}^* R_{n1} A^* D_n^* D_n + W_{n2}^* W_{n2} A^* B^* B D_n^* D_n] z^{-g},
\end{aligned} \tag{12}$$

$$\begin{aligned}
D_{c2}^* z^{-g_1} K_0 + L_0(A_w A_e) = & [Q_{n1}^* Q_{n1} z \bar{H}_1^* A^* D_n^* + \sum_{i=1}^P Q_{ni}^* Q_{ni} z^{i+1} (G_i^* A^* + \\
& F_i^* B^*)] E z^{-(P+g_1)},
\end{aligned} \tag{13}$$

其中 g, g_1 分别是使式(11), (12)和式(13)两边为关于 z^{-1} 的多项式的最小正整数. 证明从略(请参见文[1]).

本文是对文[2]的补充和发展. 在预测控制系统设计时直接考虑噪声对系统的影响, 使得系统的鲁棒性增强.
